AFE INTERFACE - Digital / Analog Boundary Unit (USB 2.0 PHY)

Legend: green = data-path boundary, purple = clock / reset / power, yellow = trim and enable registers, blue = control / status groups, orange = level shifter and isolation band, grey dashed = neighbouring digital blocks, red = analog blocks. Names ending in _A are VDDA-domain signals, _s = synchronized, _r = retimed. In the first overall diagram the TX data, RX data and line-state paths were drawn directly between digital and analog; here they are routed through the same boundary cells. The VDDA level (e.g. 3.3 V) and signal names are assumptions to be confirmed with the analog team.
